Chapter 9 - Glossary and Abbreviations

9.1 Abbreviations and Acronyms

AINW Archaeological Investigations Northwest Inc.

ASC Application for Site Certificate

BG Block Group (Census)

BLM US Department of the Interior, Bureau of Land Management

BMPs best management practices

BPA Bonneville Power Administration

Corps US Department of the Army, Corps of Engineers

CRGNSA Columbia River Gorge National Scenic Area

CRP Conservation Reserve Program

dBA Decibels (A-weighted)

DEA David Evans and Associates, Inc.

DEIS draft environmental impact statement

DEQ Oregon Department of Environmental Quality

DOGAMI Oregon Department of Geology and Mineral Industries

DSL Oregon Department of State Lands

EFH Essential Fish Habitat

EIS environmental impact statement

EMF electric and magnetic (electromagnetic) fields

EO Executive Order

EPA US Environmental Protection Agency

ESA Endangered Species Act

FAA Federal Aviation Administration

FCRPS Federal Columbia River Power System

FCRTS Federal Columbia River Transmission System

FEMA Federal Emergency Management Agency

FERC Federal Energy Regulatory Commission

FPPA Farmland Protection Policy Act
GIS geographic information system

GSU generator step-up

kV kilovolt

KVA Key Viewing Area

LGIA Large Generator Interconnection Agreement

LLC limited liability corporation

LOS level of service mph miles per hour

MW megawatt

NAAQS National Ambient Air Quality Standards

NEPA National Environmental Policy Act

NH Natural Hazards (Sherman County zone combining district)

NMFS US Department of Commerce, National Marine Fisheries

Service

NPDES National Pollutant Discharge Elimination System

NPS US Department of the Interior, National Park Service

NRCS US Department of Agriculture, Natural Resources

Conservation Service

NRHP National Register of Historic Places

ODFW Oregon Department of Fish and Wildlife

ODOT Oregon Department of Transportation

O&M operation and maintenance

OR Oregon Route

ORNHIC Oregon Natural Heritage Information Center

ORS Oregon Revised Statute
PCB polychlorinated biphenyl

PPM PPM Energy, Inc.

RI radio interference

ROD Record of Decision

RV recreational vehicle

SCADA supervisory, control and data acquisition

SHPO State Historic Preservation Office

SR-14 Washington State Route 14
TSP Transportation System Plan

TVI television interference

USC United States Code

USDA US Department of Agriculture
USDOE US Department of Energy

USFS US Department of Agriculture, Forest Service

USFWS US Department of the Interior, Fish and Wildlife Service

USGS US Geological Survey

VRM Visual Resource Management

9.2 Glossary

Access road – Roads constructed to each structure site first to build the tower and line, and later to maintain and repair it. Access roads are built where no roads exist. Where county roads or other access is already established, access roads are built as short spurs to the structure site. Access roads are maintained after construction, except where they pass through cultivated land. There, the road is restored for crop production after construction is completed.

Bay – An area set aside in a substation for special equipment.

Best management practices (BMPs) – A practice or combination of practices that are most effective and practical means of preventing or reducing the amount of pollution generated by non-point sources to a level compatible with water quality goals.

Biological Assessment – A document required by the Endangered Species Act, which requires an evaluation of potential effects on listed species and critical habitat prior to implementing a proposed action. Projected action is defined as any activity authorized, funded or carried out by a federal agency.

Bus pedestals – Supports that elevate bus tubing within a substation.

Bus tubing – A metal "bar" used to carry electricity from one piece of equipment to another within a substation.

Capacity – The maximum *load* that a generator, piece of equipment, substation, transmission line, or system can carry under existing service conditions.

Circuit breaker – A switch, installed at a substation, which breaks or restores the flow of current through the line.

Conductor – The wire cable strung between transmission towers through which electric current flows.

Conservation Reserve Program (CRP) - A voluntary federal program to assist private landowners to convert highly erodible and environmentally sensitive cropland to permanent vegetative cover.

Counterpoise – A buried wire system connected to footing of towers or poles supporting a transmission line. Used to establish a low resistance path to earth, usually for lightning protection.

Cumulative Impact – Cumulative impacts are created by the incremental effect of an action when added to other past, present, and reasonably foreseeable future actions.

Current – The amount of electrical charge flowing through a conductor (as compared to voltage, which is the force that drives the electrical charge).

dBA – The first two letters (dB) are an abbreviation for decibel, the unit in which sound is most commonly measured (see decibel). The last letter (A) is an abbreviation for the scale (A scale) on which the sound measurements were made.

Dead-end structures – Heavy towers designed for use where the transmission line loads the tower primarily in tension rather than compression, such as turning large angles along a line or bringing a line into a substation.

Decibel – A decibel is a unit for expressing relative difference in power, usually between acoustic signals, equal to 10 times the common logarithm of the ratio of two levels.

Dispersed recreation – Outdoor recreation in which participants are diffused over a relatively wide area.

Double-circuit – The placing of two separate electrical circuits on the same tower.

Easement – A grant of certain rights to use of a piece of land (which becomes a "right-of-way"). BPA acquires easements for many of its transmission facilities. This includes the right to enter the right-of-way to build, maintain, and repair the facilities. Permission for these activities is included in the negotiation process for acquiring easements over private land.

Electric and magnetic fields (EMF) – The two kinds of fields produced around the electric wire or conductor when an electric transmission line or any electric wiring is in operation.

Endangered species – Those species officially designated by the US Fish and Wildlife Service or NOAA that are in danger of extinction throughout all or a significant portion of their range.

Endangered Species Act – A 1973 federal law, amended in 1978 and 1982 to protect troubled species from extinction. The National Marine Fisheries Service (NOAA Fisheries) and the U.S. Fish and Wildlife Service decide whether to list species as threatened or endangered. Under the Act, federal agencies must avoid jeopardy to and the recovery of listed species.

Environmental impact statement (EIS) – A detailed statement of environmental impacts caused by an action, written as required by the National Environmental Policy Act (NEPA).

Federally listed – Species listed as threatened or endangered by the US Fish and Wildlife Service.

Fiber-optic lines – Special wire installed on the transmission line that is used for communication between one location and another.

Floodplain – That portion of a river valley adjacent to the stream channel which is covered with water when the stream overflows its banks during flood stage.

Footings – The supporting base for the transmission towers. Usually steel assemblies buried in the ground for lattice-steel towers.

Forb – any herbaceous plant that is not a grass or grass like.

Foreground – The viewed landscape from 0 to 0.5 miles from an observer.

Geographic information system (GIS) – A computer system that analyzes graphical map data.

Grillage – Transmission tower footings composed of a 12.5' x 12.5' assembly of steel I-beams that have been welded together and buried14 to 16 feet deep. Generally used to support heavier towers, such as **dead-end structures**.

Ground wire – Wire that is strung from the top of one tower to the next; it shields the line against lightning strikes.

High Voltage – Lines with 230-kV or above electrical capacity.

Hydrology – The science dealing with the properties, distribution, and circulation of water.

Insulators – A ceramic or other nonconducting material used to keep electrical circuits from jumping over to ground.

Intermittent – referring to periodic water flow in creaks or streams.

Kilovolt [kV] – One thousand volts.

Lattice steel – refers to a transmission tower constructed of multiple steel members that are connected together to make up the frame.

Load – The amount of electric power or energy delivered or required at any specific point on a system. Load originates primarily at the energy-consuming equipment of customers.

Megawatt (MW) – One million watts, or one thousand kilowatts; an electrical unit of power.

Milligauss (mG) - A unit used to measure magnetic field strength. One-thousandth of a gauss.

Mitigation – Steps taken to lessen the effected predicted for each resource, as potentially cause by the transmission project. They may include reducing the impact, avoiding it completely, or compensating for the impact.

National Environmental Policy Act (NEPA) – This act requires an environmental impact statement on all major Federal actions significantly affecting the quality of the human environment. [42 U.S.C. 4332 2 (2)(C).]

Non-Attainment Area – An area that does not meet air quality standards set by the Clean Air Act for specified localities and periods.

Notice of Intent - A public notice that an environmental impact statement will be prepared and considered in the decision-making for a proposed action.

Physiographic – Pertaining to the physical features of a geographic area.

Revegetate – Reestablishing vegetation on a disturbed site.

Right-of-way – An easement for a certain purpose over the land of another, such as a strip of land used for a road, electric transmission line, pipeline, etc.

Scoping – Part of the environmental impact document process where significant issues are identified for detailed analysis.

Species – A group of interbreeding individual not interbreeding with another group.

Structure – A type of support used to hold up transmission or substation equipment, such as a transmission tower.

Substation – The fenced site that contains the terminal switching and transformation equipment needed at the end of a transmission line.

Substation dead-end towers – Dead end towers within the confines of the substation where incoming and outgoing transmission lines end. Dead ends are typically the tallest structures in a substation.

Substation fence – the chain-link fence with barbed wire on top provides security and safety. Space to maneuver construction and maintenance vehicles is provided between the fence and electrical equipment.

Substation rock surfacing – A three-inch layer of rock selected for its insulating properties is placed on the ground within the substation to protect operation and maintenance personnel from electrical danger during substation electrical failures.

Switches – Devices used to mechanically disconnect or isolate equipment; found on both sides of circuit breakers.

Traditional Cultural Properties- A traditional cultural property is defined as one that is eligible for inclusion in the National Register of Historic Places because of its association with cultural practices or beliefs (e.g., traditions, beliefs, practices, life ways, arts, crafts, and social institutions) of a living community that are rooted in that community's history and are important in maintaining the continuing cultural identity of the community.

Transformer – Electrical equipment usually contained in a substation that is needed to change voltage on a transmission system.

Transmission dead-end towers - Dead end towers not within the confines of the substation, where segments of the transmission alignment come together at an angle.

Transmission line – The structures, insulators, conductors, and other equipment used to transmit electrical power from one point to another.

Volt – The international system unit of electrical potential and electromotive force.

Voltage – The drive force that causes a current to flow in an electrical circuit.

Wetlands – Those areas that are inundated, or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.
